Getting Ready: The Meeting Scheduler Problem

Understand the meeting scheduler design and learn the questions to further simplify this problem.

Problem definition

A **meeting scheduler** software allows organizations to schedule and book meetings for a group of participants. The scheduler determines a meeting time and location depending on the availability of the participants. It ensures that most of the intended participants can effectively meet on the specified date and interval. The system allows users to book and cancel meetings. The invited participants promptly receive these notifications. The organizer can also add new participants to a meeting after the meeting is scheduled.
Schedule a meeting using a meeting scheduler

Expectations from the interviewee

It is important to narrow down the components you will include in your design of a meeting scheduler. The following section provides an overview of some of the main expectations that the interviewer will want to hear you discuss in more detail during the interview.

Room assignment

A meeting scheduler is responsible for assigning a meeting room to a scheduled meeting. Make sure to ask the following questions from the interviewer to figure out how this assignment works:

- How does the system determine available rooms?
- How important is the capacity of a room when assigning a room for a meeting?

Availability of attendees

There are multiple attendees in a meeting, and all attendees have different schedules. You may ask the following questions to understand how the scheduler works:

- How does the system check the availability of the attendees?
- How does the system access the meeting information of all attendees?

Design approach

We'll design a meeting scheduler using the bottom-up design approach. For this purpose, we will follow the steps below:

- Identify and design the smallest components first, like an interval and meeting room.
- Use these small components to design additional components, for example, a meeting and a calendar.

- Repeat the steps above until we design the scheduler, which is the main component of the system.

Design pattern

During an interview, it is always a good practice to discuss the design patterns that the meeting scheduler falls under. Stating the design patterns gives the interviewer a positive impression and shows that the interviewee is well-versed in the advanced concepts of object-oriented design.

> ⓘ Try to answer the following question. If you are not familiar with design patterns, don't worry! You can learn about them by asking questions like, "Define design patterns."

Which design pattern(s) should be used to design a meeting scheduler? Please elaborate on your choice(s).

| H₁ H₂ H₃ | B I | ⋮≡ ≡ | ≡ ≡ ≡ | Tx |

Please enter the correct design pattern(s)

Let's explore the requirements of the meeting scheduler in the next lesson.
